Title: PERISTALTIC PUMP WITH MOVEABLE) (6639-000035/US)
PUMP HEAD)

APPEAL BRIEF
(37 C.F.R. § 41.37)

Mail Stop Appeal Brief – Patents
Commissioner for Patents
P.O. Box 1450
Alexandria, Virginia 22313

Dear Sir:

By Notice of Appeal filed concurrently with this Appeal Brief, Applicant appeals the Final Rejection in the above-identified application dated 18 April 2006, and submit this Brief (in triplicate) in support thereof. It is believed that no extensions of time are required. Enclosed is a check in the amount of \$500.00 for fees under 37 C.F.R. § 41.20(b1) and (b2). If any other fees, including any extensions of time, are required, please charge Deposit Account No. 08-0750.

500.00 US

I. REAL PARTY IN INTEREST

The real party in interest in the present case is Bausch & Lomb Incorporated.

II. RELATED APPEALS AND INTERFERENCES

There are no other related Appeals or Interferences known to Appellant.

III. STATUS OF CLAIMS

Currently pending claims 1-4 stand rejected under 35 U.S.C. §102 (b). Claims 1, 2, and 4 have been amended and claim 3 was originally filed. All the claims are being appealed.

IV. STATUS OF AMENDMENTS

No amendment was filed subsequent to the final rejection.

V. SUMMARY OF INVENTION

The present invention relates to a peristaltic pump 10 for use in ophthalmic surgery wherein the pump head 14 is moveable relative to the housing 12 and the backing plate 18.

VI. ISSUES

The issue raised on this Appeal is whether Claims 1-4 have been improperly rejected under 35 U.S.C. §102 (b) as being anticipated by US Patent 4,713,051 to Steppe et al.

VII. GROUPING OF CLAIMS

Claims 1-4 are each an independent claim.

VIII. ARGUMENTS

The case currently stands rejected under §102 as being anticipated by Steppe et al. It is respectfully submitted that Steppe et al. does not anticipate any of the four pending independent claims for at least the following reasons.

The Examiner asserts that Steppe teaches a pump with a pump head that is moveable relative to both a pump housing and a backing plate. This is simply not true. The pump head 82 is only moveable in the sense that it is mounted on a slideable plate 76 that is biased by a springs 78 and 79; otherwise pump head 82 is stationary.

As to independent claim 1 it is respectfully asserted that the head 82 of Steppe et al. is not moveable relative to both the housing and a backing plate, as specifically claimed. The pump head 82 of Steppe et al. will not move relative to opening 32, which is the only structure that could be argued to be a backing plate in the sense of the present invention. The pump head 82 will move as cassette 20 is inserted into unit 22 but will only move with the opening 32; therefore the head 82 will not move relative to the opening 32 but rather moves in unison with the opening 32. So head 82 always remains stationary relative to the opening 32. Therefore, Steppe et al. does not disclose the specifically claimed element of a pump head movable relative to the backing plate.

The Examiner, relative to claim 1, asserts that the pump head 82 of Steppe et al. moves towards opening 32. It is respectfully submitted that no such movement occurs. The spring biased plate 76 upon insertion of the cassette 20 only will move in the same direction as the cassette moves. The opening 32 moves, during insertion, relative to the head 82 but never does the head 82 move relative to the opening 32 as specifically claimed. In addition, the head 82 never moves towards the backing plate to an operative position as specifically claimed.

In addition, the Examiner asserts that the opening 32 is attached to the housing as specifically claimed. This is simply an unreasonably broad interpretation of attached. The opening 32 is part of cassette 20, which is a totally separate structure from unit 22 and is a removable device. To say that the

opening 32 is attached to the housing is simply not credible. The opening 32 is formed in cassette 20. The cassette 20 is then attached to the cassette mechanism (co. 9, lines 29-30). It is unclear to what the cassette mechanism is attached. Therefore, yet another limitation of claim 1 is not met by Steppe et al.

As to independent claim 2, the same arguments presented above apply.

In addition, claim 2 requires that the pump head moves relative to the housing and towards and away from the backing plate. Since the plate 76 of Steppe et al. is only spring biased and not independently movable the head 82 cannot be said to move both towards and away from the opening 32. At best head 82 can only be said to move in one direction, with the movement of opening 32 as cassette 20 is inserted.

As to independent claim 3, the same arguments presented above apply. The opening 32 of Steppe et al. is not attached to the housing of the unit 22 and the pump head 82 does not move relative to the housing and a backing plate, as required by the claim.

As to independent claim 4, the same arguments presented above apply. In addition claim 4 includes a surgical cartridge (or cassette) that is separate from the backing plate. Claim 4 specifically sets forth that the backing plate is attached to the housing and the cartridge is placed in a drawer. This clearly distinguishes Steppe et al. as the opening 32 is part of the cartridge. Contrary to the Examiner's arguments claim 4 clearly sets forth a backing plate that is separate from the surgical cartridge.

Claim 4 furthers sets forth that the drawer is moveable from an open position to an operable position. Steppe et al. do not disclose a drawer but rather a slot 26. A slot is not a drawer that moves as claimed, but rather is simply a stationary hole into which cassette 20 is inserted. The Examiner asserts that the cassette bottom housing 28 and cassette edge 36 with slot 26 form a drawer. It is totally illogical to say that a thing to be inserted (the cassette 20, including bottom 28 and edge 36) can itself form the drawer. Things, e.g. cassettes or cartridges are placed into drawers or slots but are not themselves drawers or slots. Therefore, Steppe et al. is totally void of this claimed element.

Claim 4 still further claims that, after the drawer has moved to the operative position, the pump head moves toward the backing plate. Even if the cassette and slot in some stilted and illogical way could be said to be a drawer that moves, once the 'drawer' had moved in Steppe et al. the pump head 82 in no way moves as claimed in the present invention.

As the Federal Circuit has stated "anticipation requires the disclosure in a single prior art reference of each element of the claim under consideration". *W.L. Gore & Assocs. V Garlock, Inc.*, 721 F.2d 1540, 220 USPQ 303, 313 (Fed. Cir. 1993). The Examiner has wholly failed to show such anticipation. In view of the above arguments, it is clear that Steppe et al. does not anticipate any of the four independent claims and the present application is in condition for allowance at an early date.

IX. APPENDIX

1. (Previously Amended) A peristaltic pump for use in ophthalmic surgery

comprising:

a housing;

a pump head having a plurality of rollers held within the housing;

a backing plate attached to the housing;

resilient surgical tubing positioned between the pump head and the backing

plate; and

wherein the pump head is moveable relative to the housing and the

backing plate, such that when the pump head is in an open position

the surgical tubing is easily inserted between the pump head and

the backing plate and wherein the pump head then translates

towards the backing plate to an operative position, such that as the

pump head is rotated the rollers and backing plate cooperate to

compress the tubing to peristaltically pump aspirant from a surgical site through the tubing.

2. (Previously Amended) A peristaltic pump for use in ophthalmic surgery comprising:

a housing;

a pump head having a plurality of rollers held within the housing;

a backing plate attached to the housing and for cooperation with the

pump head; and

wherein the pump head moves relative to the housing and towards and away from the backing plate.

3. (Original) A peristaltic pump for use in ophthalmic surgery comprising:

a housing;

a pump head having a plurality of rollers extending from the housing;

a backing plate attached to the housing and for cooperation with the

pump head; and

wherein the pump head moves relative to the housing and backing

plate from an open position to an operative position for insertion of

resilient surgical tubing between the rollers and the backing plate for

peristaltically pumping aspirant through the tubing from a patient's eye

during surgery.

4. (Previously Amended) A peristaltic pump for use in ophthalmic surgery comprising:

 a housing;

 a pump head having a plurality of rollers held within the housing;

 a backing plate attached to the housing and for cooperation with the pump head;

 a surgical cartridge including a length of resilient tubing connected to a collection bag and for connection to a surgical aspiration device via additional tubing; [and]

 a cartridge holder drawer for holding the surgical cartridge and moveable from an open position to an operative position; and wherein the pump head moves relative to the housing, such that after the drawer moves from the open position to the operative position, the pump head is moved toward the backing plate, such that the rollers and the backing plate cooperate to peristaltically pump aspirant through the length of tubing as the pump head is rotated.

Respectfully submitted,

Michael L. Smith
